

## Smart cities run on smart power

By Marc Cram, BSEE, CDCD

# EXECUTIVE SUMMARY

A cooperative effort between city governments and private enterprise is leading cities to adopt the goal of becoming “smart cities.” While the definition of a smart city depends on who you ask, the common understanding seems to be that a smart city provides for the real-time monitoring and control of the infrastructure and services that are operated by the city, thereby reducing energy use, reducing pollution, improving public safety, and improving the quality of life for the citizens and visitors of the smart city.

Smart cities require vast arrays of widely distributed sensors and control devices dispersed throughout. In turn, both wired and wireless networks are deployed to join the sensors and control systems together. These systems gather, store, and process data, and then widely distribute the distilled information in a timely fashion to the point(s) where the information can be acted upon or consumed. Edge computing infrastructure handles time sensitive applications and data aggregation, while private and public cloud infrastructure provides general purpose utility computing, big data analysis, and long-term information storage.

In smart cities, remotely managed power distribution provides a means of reducing power consumption, resetting disparate hardware systems, and providing localized environmental monitoring for both the control systems and the networking hardware that make a city “smart.” This paper explores the critical role intelligent power distribution plays in making “smart” happen.

## INTRODUCTION

In the early 1980s, the last of the Baby Boomers entered college. Music was distributed through vinyl albums and cassette tapes. News was communicated through newspapers, live television, and radio broadcasts. Free over the air radio was the go-to source for news, weather, and traffic information for most people. Cellular phones were just a concept being explored. And personal computers went from being a hobbyist toy to an essential commercial tool for word processing, running small databases, and doing simple analytics through spreadsheets.

Throughout the 1980s, the major cities around the globe experienced the pains of non-stop population growth. By 1990, “Ninety percent of the population growth occurred in metropolitan areas of more than one million people. For the first time, a majority of Americans lived in these large metropolitan areas.”<sup>1</sup>

Today, 54% of all people globally live in cities, with that figure expected to reach 70% by 2050.<sup>2</sup> As of 2008, there were more than 400 cities with a population over 1 million, and 19 cities with a population of over 10 million. India, China, and Nigeria are expected to account for 37 percent of the world’s urban population growth between 2014 and 2050.

---

<sup>1</sup> <http://www.nytimes.com/1991/02/21/us/us-says-most-of-growth-in-80-s-was-in-major-metropolitan-areas.html> Edward Fiske, NY Times

<sup>2</sup> <http://www.prb.org/Publications/Lesson-Plans/HumanPopulation/Urbanization.aspx>

With a limited amount of space and resources, modern cities are struggling to provide their citizens with the growing quality of life that they have come to expect. City planners have resorted to increasing the population density per square kilometer to lessen the need for growing the boundaries of the city limits. And they push aggressively for improving the energy efficiency of everything that is plugged into the city's electrical grid. Streetlamps are migrating from mercury vapor to LED, appliances are required to be Energy Star rated, offices required to turn off their lights when not occupied, thermostats set to higher temperatures to reduce the energy demands arising from air conditioning systems. The adoption of renewable energy sources is mandated to lessen the need for the oil and coal consumption that enable the transportation systems and electronic systems of mobile citizens. Meanwhile, the adoption of electric cars, electric bikes, and other electronic gadgets is placing additional demand on the existing power generation facilities at a rate greater than efficiency programs can offset, requiring additional power sources to be brought on line.

City planners and managers are seeking new ways to change consumption patterns and behaviors of the companies and people occupying the city to make the city more sustainable and more socially equitable.<sup>3</sup> "While (energy) consumption has typically been tied to population growth, a study<sup>4</sup> (from McKinsey Global Institute) finds that just a quarter of global growth between 2015 and 2030 will come from a rise in

the number of consumers. Instead, the great bulk of it will come from their increasing incomes and purchasing power. Large cities will account for 91 percent of consumption growth between 2015 and 2030."<sup>5</sup> "As of 2014, midtown Manhattan (New York) used more power daily than did the entire country of Kenya."<sup>6</sup> One of the first tools to be deployed by the cities are "smart grids" where electrical meters can be remotely read and have the ability to shed (turn off) excessive loads at times of peak demand.<sup>7</sup>

Reducing energy consumption is only part of the picture for Smart Cities. Incorporating more renewable energy generation capacity along with a variety of energy storage options is also a key focus of city planners and administrations trying to support the growing energy demand being driven by population growth and the move away from oil dependency for vehicles.

Jack Gold, an analyst at J. Gold Associates, is quoted<sup>8</sup> as saying that "'Smart City' is one of those all-encompassing terms that everyone defines however they want." Gold added, "The ultimate goals of smart cities are power management, reducing pollution footprints, increasing public safety, or offering improved services to residents."

<sup>8</sup> Article by Matt Hamblen, Sr Editor, Computerworld - <https://www.computerworld.com/article/2986403/internet-of-things/just-what-is-a-smart-city.html>

# WHAT IS A SMART CITY?

Wikipedia takes a narrower view when it says “A smart city is an urban development vision to integrate information and communication technology (ICT) and Internet of Things (IoT) technology in a secure fashion to manage a city’s assets. These assets include local departments’ information systems, schools, libraries, transportation systems, hospitals, power plants, water supply networks, waste management, law enforcement, and other community services.”<sup>9</sup>

For the purposes of this paper, a smart city is any city that utilizes IoT and networking technologies to manage power, manage traffic, manage resources, and deliver a variety of improved services to its occupants. The smart city may incorporate the use of both edge and cloud computing to handle the large volumes of data generated, processed, and consumed by the city as it operates each day. Here comes the fun part. The decision to deploy at a colo has been made. Next decisions center around whether you will be taking gear out of your existing data center and relocating it, or whether you will be deploying all new IT hardware to the colo facility.

<sup>9</sup> [https://en.wikipedia.org/wiki/Smart\\_city](https://en.wikipedia.org/wiki/Smart_city)

## TOP 10 SMART CITIES

According to Wordlbasel.in, here are the most impressive Smart Cities globally. Judged on the basis for the criteria of aiming to give the best quality of life to their citizens through the use of the latest technologies while minimizing the consumption of natural resources and reducing costs:

1. Seoul
2. San Francisco
3. Hong Kong
4. Singapore
5. Rio de Janeiro
6. London
7. Stockholm
8. Chicago
9. Seattle
10. Vienna

# SYSTEMS, SENSORS AND NETWORKS

Just as the invention of the silicon transistor led to the development of the integrated circuit, Moore's law has guided successive generations of chip development to provide ever greater functionality in smaller packages that consume less power per operation and cost less per unit. Today's microprocessors and microcontrollers cost pennies apiece, can be powered by a single cell battery, and deliver wireless connectivity over a wide range of distances and bandwidths. Engineers and Makers<sup>10</sup> alike design these devices into an ever-growing range of applications that provide measurement, monitoring, and control capabilities found in products and services throughout our everyday lives. When combined with the appropriate sensors and power source, these microcontrollers deliver a constant stream of data that can be collected and analyzed to deliver both actionable intelligence and granular control.

The most common sensor types deployed in smart cities are:

- Electric meters
- Natural gas meters
- Water meters
- Thermostats
- Occupancy sensors
- Touch sensors
- Air quality sensors
- Traffic cameras and pavement sensors
- Security cameras
- Sound sensors / gunshot detectors
- Smoke and fire sensors
- Card readers and access controllers
- Rain gauges and anemometers
- Ozone detectors
- Radiation sensors

Recently developed sensors are adding to the wide variety of data available to the cities:

- Building health (accelerometers, strain gauges, tilt sensors that detect settling, wind, and earthquake effects)
- Facial recognition systems
- Parking sensors that identify open parking spaces
- Carbon dioxide and carbon monoxide detectors
- Seismic sensors
- Gutter and street flood detectors
- Flow rate sensors (inside individual pipes)
- Trash and recycling bin status sensors
- Proximity detectors
- Crosswalk activity sensors
- Metal detectors
- Pressure sensors

<sup>10</sup> [https://en.wikipedia.org/wiki/Maker\\_culture](https://en.wikipedia.org/wiki/Maker_culture)

For most purposes, sensor data is of little value until it is gathered, processed, disseminated, and acted upon. The “smart” in the smart city moniker refers to what happens with the data that comes from the sensors throughout the city.

## Control

- Traffic signs to re-route traffic, warn of accidents flooding, etc.
- Traffic signs that automatically update with “time to destination” information
- Traffic flow data sent to Google, Apple, Waze and city management applications to suggest alternate routing
- Maintenance / dispatch notices sent to trigger garbage pickup, bathroom cleaning, pipeline maintenance
- Dispatch of emergency personnel for firefighting, shots fired, traffic accidents, road repairs
- Automated pickup of garbage, recyclables, and yard wastes (sensors on street to tell that containers are present and waiting for pickup, like [www.bigbelly.com](http://www.bigbelly.com))
- Turn on street lights at various times and conditions
- Crosswalk monitoring / change of traffic signals / crosswalk flashers
- Monitoring public pool chemistry and support systems
- Re-routing internet traffic in the event a fiber or cable has been cut
- Coordinating aerial drone traffic routing
- Building health monitoring
- Scheduling of irrigation systems for sidewalk plants, **parks, and other common green spaces**
- Sharing of data for educational and research purposes
- Turning off non-critical systems at schools and other public buildings during times when they are not in use

## Apps

- Transportation guidance for pedestrians, cyclists, car drivers, bus and train riders
- Coordination of ride sharing and van pooling
- Traffic alerts, wind alerts, air quality alerts, water quality alerts, shots fired warning sent to smartphones
- Display proximity to public drinking fountains, restrooms, and other facilities
- Direction to nearest ATM, subway station, bus station, etc.
- Smartphone apps that show parking space availability and reservation systems
- Vehicle charging system location, availability, and reservation systems
- Access control to public restrooms
- Paying city bills

- Voting
  - Reporting violations of rules and regulations
  - Augmented and virtual reality applications for guided tours, guided repairs and the like
- API interface to natural language interfaces such as Alexa, Cortana, Siri, and Google Now

## Utilities

- Electric meter system monitoring/billing/control
- Fresh water system monitoring/billing/control
- Waste water system monitoring/billing/control
- Natural Gas system monitoring/billing/control

Sensors report back to monitoring and control systems through a variety of networking technologies such as

- RFID
- NFC
- Bluetooth and Bluetooth Low Energy (BLE)
- ZigBee
- LoRA and LowPAN / 802.15.4
- Wi-Fi
- Ethernet LAN/MAN/WAN
- Fiber optic
- Broadband over power line (BPL)
- 2G/3G/4G cellular

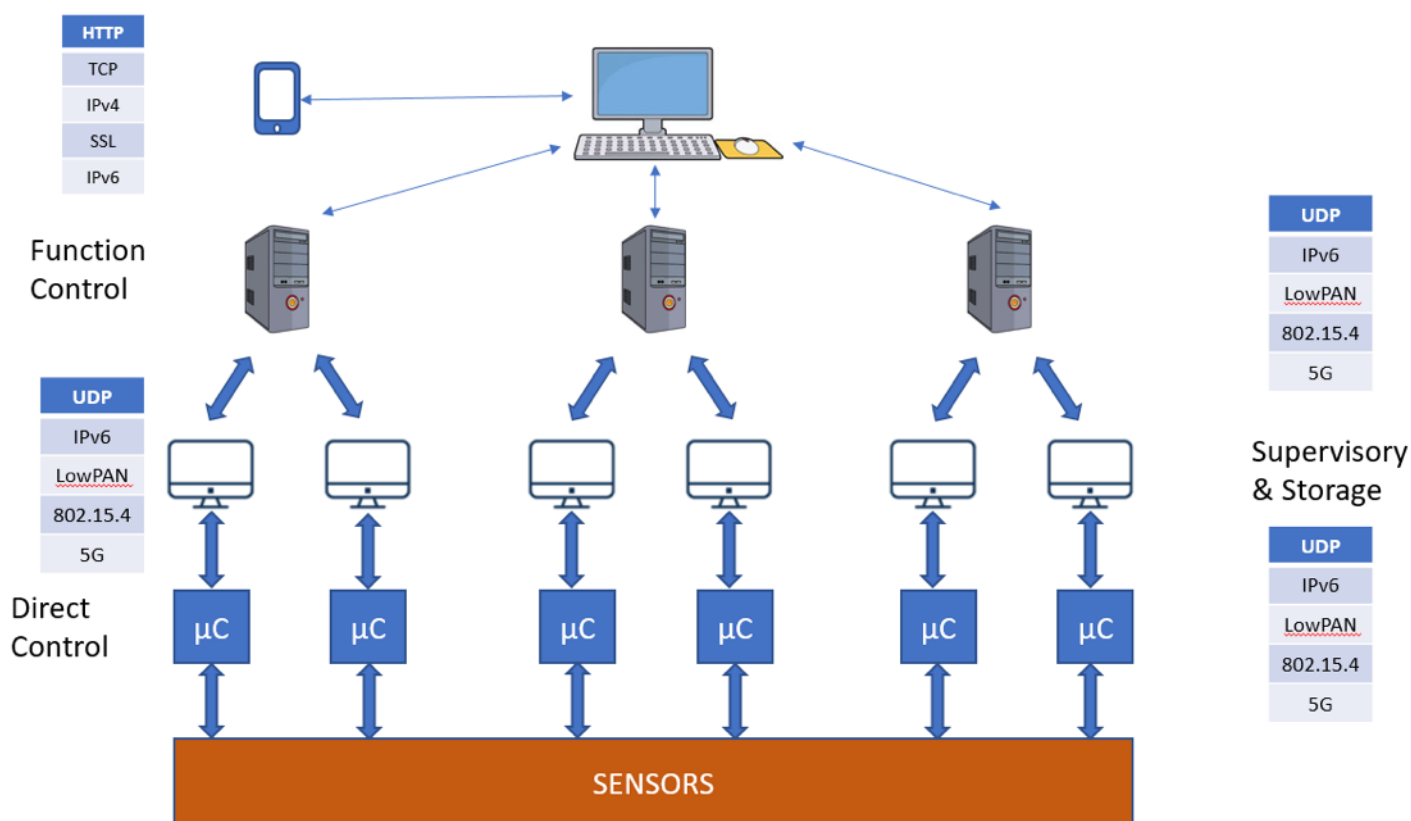

Figure 2: IoT Data Collection

Future connectivity may come in the form of wireless networks using a variety of protocols

- 5G cellular
- Li-Fi
- LTE-U
- LAA (Licensed Assisted Access)
- MultiFire <sup>11</sup>

Frequently these networking technologies require gateways, switches, or routers to be in proximity to where the sensors are deployed. Depending upon the application, some of the sensors may be deployed in a time sensitive control application. This means that they may be distributed throughout the urban environment, in edge or fog computing deployments. The systems operate unattended by local human supervisors. In that case, they frequently report up through the network to central monitoring points (NOCs, or network operations centers). A macro view of the data coming from the networks may also go to a cloud facility somewhere for long term storage and analysis. For example, meter readings, traffic data, etc. may all be processed by “big data” or “AI” applications looking for patterns, trends, and the like.

Federal regulations may require that some of the data be summarized and reported up to the federal level. Water usage, water quality, power usage and the like all up at the Environmental Protection Agency (EPA) for example. Population data and trends go to the Census bureau. Crime data goes to the FBI. Temperature and precipitation data go to the National Weather Service.

With the prevalence of Application Program Interfaces (APIs) and other data interchange standards, there is no need for a human to be involved in the review chain before data is passed along. The local gateways and databases can communicate directly with their federal counterparts to keep systems up to date almost in real time.

<sup>11</sup> <https://www.qualcomm.com/invention/technologies/lte/multifire>

# THE ROLE OF THE CITIZEN SENSOR

Data surrounds every individual today. Some of it is deliberately generated (selfies, videos, phone calls), and some is collected from the individual (heartbeat data, steps taken, location, websites visited, goods and services purchased) whether they are conscious of it or not. The personal fitness tracker and the ubiquitous smartphone combine to produce much of the data, with the smartphone providing the majority. And more than 60% of the world's population today carry a smartphone. Collectively, smartphones represent the single largest source of data on what is going on with people globally.

The typical smartphone has accelerometers, light sensors, cameras, microphones, GPS, and a magnetometer/compass. Communications into and out of the smartphone takes place via Wi-Fi, Bluetooth, NFC, and cellular radios. Applications of many varieties collect both the sensor data and metadata. For example, the Facebook app may be used to share a photograph with friends, family and followers. But that photograph also carries with it information about the date and time it was taken, and may also carry GPS coordinates. If the photographic image contains a face, an algorithm running at a Facebook data center will also perform facial recognition and tag the friends present in the photo.

## THE CITIZEN SENSOR - AN URBAN CYBORG

Openly sharing the data from a smartphone helps populate navigation systems with real time traffic information (speed, traffic jams). It also can be used to monitor the condition of the roads themselves – to automatically make note of pothole locations (a sharp jolt on the accelerometer), for example.

But smartphones are not the only tools that collect the information that defines your existence. A visit to the doctor generates a flood of information pouring into an electronic health records (EHR) system. This in turn leads to billing systems and insurance systems. When you are at home, your television watching habits may be monitored by your cable provider or by Netflix, your electric meter tracks your appliance usage, your telephone knows who you have spoken with, your thermostat tells if you are home and what room you occupy. Your doorbell knows when someone approaches the entry to your home, and automatically opens the lock for you and people you designate for authorized entry. Spotify knows the music you listen to, Apple knows the podcasts you listen to and where your photos are taken.

## POWERING THE SENSORS, SYSTEMS, AND NETWORKS

Beyond the sensors that we carry with us in our battery powered phones, the sensors of the smart city are deployed in a wide variety of locations. Car presence detectors on the pavement of the roads and parking garages. Crosswalk presence detectors. Light sensors in the street lights. Utility meters on the homes, offices, and factories. Thermometers, ozone detectors, radiation detectors, smoke detectors may be combined into a “weather station” found on light poles and rooftops throughout a city. Cameras and ultrasonic sensors may be found at street intersections to detect vehicles and adjust timing of the stop lights based on demand. Stop light control systems are frequently found nearby in outdoor enclosures. **See Table 1.**

Local power generation by solar cells and fuel cells will support those sensors that are not near utility power, or where the city prefers not to have these loads present on the grid. **See Table 1.**

As previously noted, getting data from these disparate sensors requires a variety of connectivity solutions to get data from the sensor to a point where it can be processed, analyzed, and stored.

“Smart cities use technology to assist their residents, and data is a byproduct of that effort. But who owns the data and how it’s used is up for debate, and it often depends on where you live.”<sup>12</sup>

## THE CASE FOR REMOTE POWER MANAGEMENT IN THE SMART CITY INFRASTRUCTURE

The growing number of sensors and systems deployed throughout the smart city mean that city staffers must oversee the installation, maintenance, and operation of more products in more locations. Frequently the city employees rely on manufacturers to provide support. When a city the size of Tokyo, Los Angeles, or Houston implements thousands, or even millions, of sensors, sending a person to troubleshoot every fault becomes both time consuming and cost prohibitive. Having the ability to remotely or automatically reset the failing sensor, device, controlling equipment, or network makes good sense, as it saves both time and money through avoiding the cost of dispatching a person and a vehicle to a remote location to “hit the reset switch.”

Numerous city-managed systems are deemed “too critical to fail.” Priority is given to traffic control signals, for example, due to the potential for lethal impact whenever traffic lights go out. Fresh water pumping stations are another application that have a rapid impact when they go down. Repeater stations used by first responders to provide dispatch and emergency digital communications are crucial to maintaining ambulance, fire, and law enforcement services. However, getting a service person on site whenever these systems have glitched, frozen, or otherwise gone offline may not be practical. Timeliness is essential and having the ability for the city’s central monitoring point to remotely reset the failing hardware can dramatically improve the perception by the city’s populace that the city is “on top of things.”

“... if an entire city has an “operating system”, what happens when it goes wrong? The one thing that is certain about software is that it crashes. The smart city, according to Hollis, is really just a “perpetual beta city”.”

Steven Poole, [theguardian.com](http://theguardian.com)

As a first line of defense, remote monitoring of the power being supplied to sensors, gateways, and control systems is a “must have” for ensuring system uptime and reliability. Depending on the application, gateways and control systems may be located on shelters (huts), on rooftops, in NEMA enclosures, or within IDF's within a nearby building. The EMX and SRC families from Raritan, a brand of Legrand, are ideal solutions where monitoring of systems is all that is required. These units support remote monitoring of doors, IP-based cameras, environmental sensors for temperature, humidity, smoke, floor mount leak detectors and air pressure. They can also interface to card-controlled rack and door locks for remote access control. Through a partnership with PowerShield, the Raritan EMX and SRC are able to provide data on lead-acid batteries used as UPS and standby power applications like those found in telecom infrastructure.

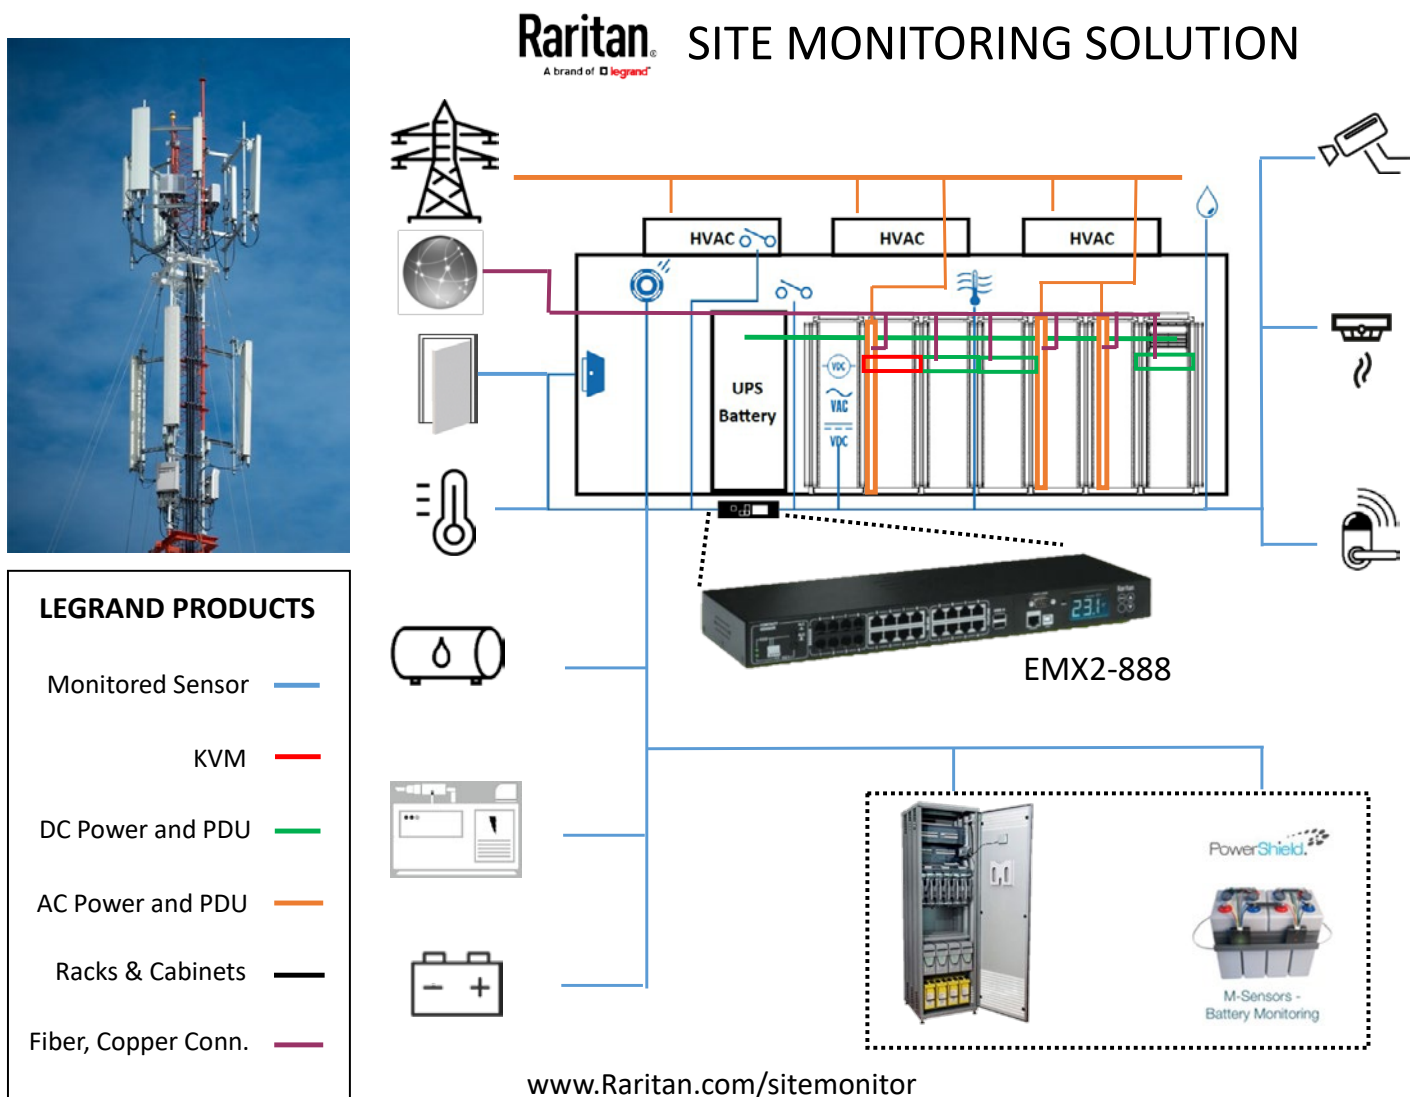

Figure 4: Raritan Site Monitoring Solution

Displays like the one pictured in **Figure 5** below are a common sight in airports and train stations where status screens are frequently left on around the clock, and the systems driving the displays may be located remotely or even off site from the display. An intelligent PDU with switching capability (remotely managed) can help reset the systems that drive this display

Figure 5: Frozen Airport Display

Using network-accessible remotely monitored and managed power distribution units (PDUs) can help bring the stop light systems up in the proper order, monitor the temperature and environmental conditions within the cabinet or enclosure housing the stop light controllers, and detect whether a vandal has opened the doors to the cabinet by detecting the status of dry contact closures.

Having infrastructure that is powered by intelligent PDUs also provides a path to reduced energy expenditures by turning off assets that do not need to remain on when they are not in use. For example, city buildings such as libraries, schools, and museums can all be powered down when not in use, saving money and being “greener” for the environment.

Whether your infrastructure is AC-powered or DC-powered, there is a Legrand power distribution unit available from Server Technology or Raritan that is suited to your application. We offer remotely managed intelligent power products capable of supporting loads up to 100kW.

**Figure 6** is a -48VDC PDU from Server Technology that offers remote power measurement and remote power switching for up to 15kW of power.

Figure 6: -48VDC PDU from Server Technology

Also available from Server Technology are a wide variety of 1U and 2U PDUs suited to most small cabinet applications where remote power monitoring and remote outlet switching are needed. The **Figure 7** below shows our patented High Density Outlet Technology (HDOT). Not pictured are ports for ethernet, temperature and humidity probes.

Figure 7: 208V AC PDU from Server Technology

Other AC PDUs from Server Technology offer our latest innovation, the HDOT CX outlet that is suitable for replacing both C13 and C19 outlets in most applications.

**See Figure 8.**

Figure 8: HDOT Cx OutletsT

The Raritan brand of PDUs feature the Xerus platform and our top of the line NIC for state of the art usability, reliability, and flexibility.

Intelligent power products require mission-critical connectivity to maximize their usefulness. This is where working with Legrand makes your life easier, because we provide more of what you need to meet the expectations of your most demanding clients and citizens. With a full range of the highest quality, most reliable connectivity infrastructure in the industry, Legrand brings together more of what it takes to keep your Smart City running smoothly.

Legrand offers fiber and copper connectivity through their Ortronics and Quiktron brands. We also offer rack systems, cabinets, cable raceways, cooling and containment solutions for your most demanding applications.

# 10 STEPS TO A SMART CITY

1. Strong public-private partnerships
2. Data openness and third-party collaboration
3. User-first information resources for public services
4. Free, citywide internet connectivity
5. Smart kiosks
6. Smart public transport
7. Getting smart on public safety
8. Green, sustainable solutions
9. Digital voting systems
10. Prepare for autonomous vehicles and the sharing economy

Source: Smart Cities Summit

## CONCLUSION

Smart Cities take advantage of the power of harnessing data to make day to day living comfortable, convenient, and efficient. They seek to help their citizens achieve meaningful, exciting lives rather than implementing technology for its' own sake. Putting information and services in the hands of the population gives the citizens a sense of participation and belonging to the community, while concurrently enabling the city administrators to run the systems that keep the trains, planes and buses on time, the traffic moving, and the utilities up and running.

"Anticipated benefits of smart city solutions include cost savings from operational efficiencies; optimizing use of resources; improved government services and interaction for citizens; better stream of data to improve decision-making; and the opportunity to attract tech-savvy workers and businesses."

"The next phase of smart cities growth will be contingent on expanding the depth and breadth of expertise among government IT staff and, as challenging as it may be, to expand their workforce," said Tim Herbert, senior vice president, research and market intelligence, CompTIA.<sup>14</sup>

With the breadth of sensors (IoT), systems (edge computing), and networks (5G) that go into making the Smart City "smart," it is imperative that the architects and designers provide for an efficient means of remotely monitoring and resetting the underlying hardware to minimize downtime, avoid costly truck rolls, and ensure the satisfaction of the citizens relying on the use of those systems. Working with trusted partners that are Power Strategy Experts such as the Raritan and Server Technology brands of Legrand to power the sensors, systems, and networks of the City, is just plain smart.

# WHY SERVER TECHNOLOGY

Server Technology's power strategy experts have provided power solutions for labs, data centers, branch offices and telecommunications operations for 30 years. Over 60,000 customers around the world rely on our cabinet power distribution units and award winning power management solutions to reduce downtime, facilitate capacity planning, improve energy utilization, and drive efficiency. With the best quality, best technical support and most patents, Server Technology products provide uncompromising reliability, innovation, and value for the datacenter.

Only with Server Technology will customers Stay Powered, Be Supported and Get Ahead.

# WHY RARITAN

Raritan, a brand of Legrand, delivers more than 30 years of innovation and experience from the data center market to your IoT and smart city network operations centers. Our products remotely monitor every critical aspect of your gateways and edge data centers:

- Remote Access & Control to Reduce On-site Maintenance
- AC & DC Power Management
- Technology Extensions to Virtually Any Internal Applications with our Xerus Platform

See for yourself how Raritan can help you reliably deliver power, access, and control for your smart city applications.

# WHY LEGRAND

At Legrand, we deliver access to power, light and data to millions of spaces around the world.

### SMARTER SMART CITIES

The "smart cities" agenda is mainly focused on top down technological initiatives (embedded sensors, data integration and analytics). The real smart cities of the future will mobilise human intelligence as well as artificial intelligence, bottom up creativity as well as top down control.

## APPENDIX 3: SMART STREET LAMPS

Street lights could carry a multitude of roles for the Smart City. Amongst the many functions they could perform are

- Weather station – wind speed and direction, rainfall gauge, temperature, humidity, barometric pressure
- Flood monitor
- Mesh wireless access point
- Traffic monitor
- Gunshot monitoring
- Cry for help monitoring
- Cross walk monitoring
- Citizen tracking (what smartphones are nearby...)
- Spectral output/intensity control/power load/ based on time of night, RF field intensity measurement
- Information display

## APPENDIX 4: SMART BUILDINGS

## APPENDIX 5: UNANSWERED QUESTIONS

There are many other potential technologies to be developed and deployed to support Smart Cities. The expectations around Smart City infrastructure and the services derived from it will evolve over time. The author of this paper is left with many unanswered questions, such as:

- Will smartphones be used as access credentials for applications beyond hotel rooms? Would they be used for public restrooms? For public buildings? For public transportation?
- Will agricultural robots/sensors/harvesters be used for urban food production?
- Will the programs that run everything be like the programs in The Matrix, where older programs are put out to pasture by newer ones?
- What role will Big Data, Artificial Intelligence, smartphones, edge computing play in the Smart City?
- What are the ramifications for RF spectrum/bandwidth?
- What will change for the citizens of smart cities versus other cities?
- Will there be a “race to the top?” between cities worldwide?
- What will the smart city do for other human necessities – food, clothing, medical care, shelter? What becomes of the homeless and the poor? Gentrification/classes?
- What happens to education in a smart city – will it centralize? Decentralize?
- What are the occupations of people in Smart Cities?
- What role does the city, state, national government play in enabling/creating/maintaining a Smart City?
- What industries support a Smart City? Where do other industries go if they are not in a Smart City?
- Does the Smart City serve the government, or vice versa?
- Are smart cities “fun?” Are they technology hubs, or are they art colonies? Are they just surveillance engines?
- Will government oversight/control of everything be accepted?
- How will it all be paid for?
- Will there be an alternative form of currency that supports the “Smart City?”
- How is the information collected and used at the local, county, state, and country? Does the city have to share with other governments?
- Must utilities share their information with law enforcement?

### About Raritan

Raritan began developing KVM switches for IT professionals to manage servers remotely in 1985. Today, as a brand of Legrand, we are a leading provider of intelligent rack PDUs. Our solutions increase the reliability and intelligence of data centers in 9 of the top 10 Fortune 500 technology companies. Learn more at [Raritan.com](http://Raritan.com)
